

Notes on *Cnidoscolus* (*Euphorbiaceæ*), 27-29

Francisco Javier FERNÁNDEZ CASAS

FONTQUERIA 55(45): 343-360 [repaged offprint: 1-18]
MADRID, 12-XII-2006

FONTQUERIA is a series of botanical publications without administrative affiliation. It publishes original works in Botany, particularly those that are of interest to the editors. Its publications are in any language, the only limitation being the ability of the editorial team.

Accredited with the *International Association for Plant Taxonomy* for the purpose of registration or new non-fungal plant names.

Notes on *Cnidoscolus* (*Euphorbiaceæ*), 27-29

Francisco Javier FERNÁNDEZ CASAS
Real Jardín Botánico. E-28014 Madrid

FERNÁNDEZ CASAS, F. J. (12-xii-2006). Notes on *Cnidoscolus* (*Euphorbiaceæ*), 27-29. *Fontqueria* 55(45): 343-360 [repaged offprint: 1-18].

Keywords. Systematics, New species, *Cnidoscolus* sect. *Cnidoscolus* (*Euphorbiaceæ*), Brazil (Bahia).

Abstract. Two new species are proposed under *Cnidoscolus* (*Euphorbiaceæ*): *C. hypokerinus* and *C. rupestris* from Brazil (Bahia).

Zusammenfassung. Es wird hier zwei neue Arten der Gattung *Cnidoscolus* (*Euphorbiaceæ*) beschrieben: *C. hypokerinus* und *C. rupestris* aus Brasil (Bahia).

Resumé. Deux nouvelles espèces sont décrites dans le genre *Cnidoscolus* (*Euphorbiaceæ*): *C. hypokerinus* et *C. rupestris* du Brésil (Bahia).

Resumo. Descrivem-se duas novas espécies no gênero *Cnidoscolus* (*Euphorbiaceæ*). Três são brasileiras: *C. hypokerinus* e *C. rupestris* de Bahia.

Resumen. Se describen dos especies nuevas del género *Cnidoscolus* (*Euphorbiaceæ*). Ambas son brasileñas, del estado de Bahia: *C. hypokerinus* y *C. rupestris*.

Two new species are described in the genus *Cnidoscolus* Pohl (*Euphorbiaceæ*, *Crotonoideæ*, *Manihoteæ*). Both were discovered during the recent study (2006) of the collections of the herbaria ALCB (Salvador, Bahia), CEPEC (Ilhéus, Bahia), HUEFS (Feira de Santana, Bahia), SP (São Paulo), SPF (São Paulo), whose responsible they put kindly to my disposition. I would like to express my gratitude to the curators of these herbaria for so kindly making them available to me. One of the novelties was also observed and photographed in the field, repeatedly, in February of 2006, by myself and my friend Andrés Ceballos Jiménez, an engineer in Madrid.

The two new species described are attributed to the type series of section *Cnidoscolus*, both autonymous. The series is characterized by the presence of prickles and by whole leaves, without true summipetiolar glands, or with very reduced ones, or which have been replaced by urticant bristles to take their place, cf. F. J. FERNÁNDEZ CASAS & J. M. PIZARRO DOMÍNGUEZ (2001: 40s, n° I.AA), F. J. FERNÁNDEZ CASAS (2003: 81-82).

Regarding their distribution, both species seem to be endemisms which are very localized in rocky outcrops of the north and center of the state of Bahia.

27 *Cnidoscolus* Pohl sect. *Cnidoscolus* ser. *Cnidoscolus* autonymus

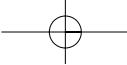

SPECIES TYPICA: *Cnidoscolus hamosus* Pohl (1827)

DISTR. GEOGR. **America australis:** Brasil, Perú; cf. tabula 1 (pag. 344).

BIBLIOGR. F. J. FERNÁNDEZ CASAS & J. M. PIZARRO DOMÍNGUEZ (2001: 41, n° I.AA.1a); F. J. FERNÁNDEZ CASAS & J. M. PIZARRO DOMÍNGUEZ (2005: 1).

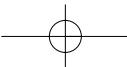

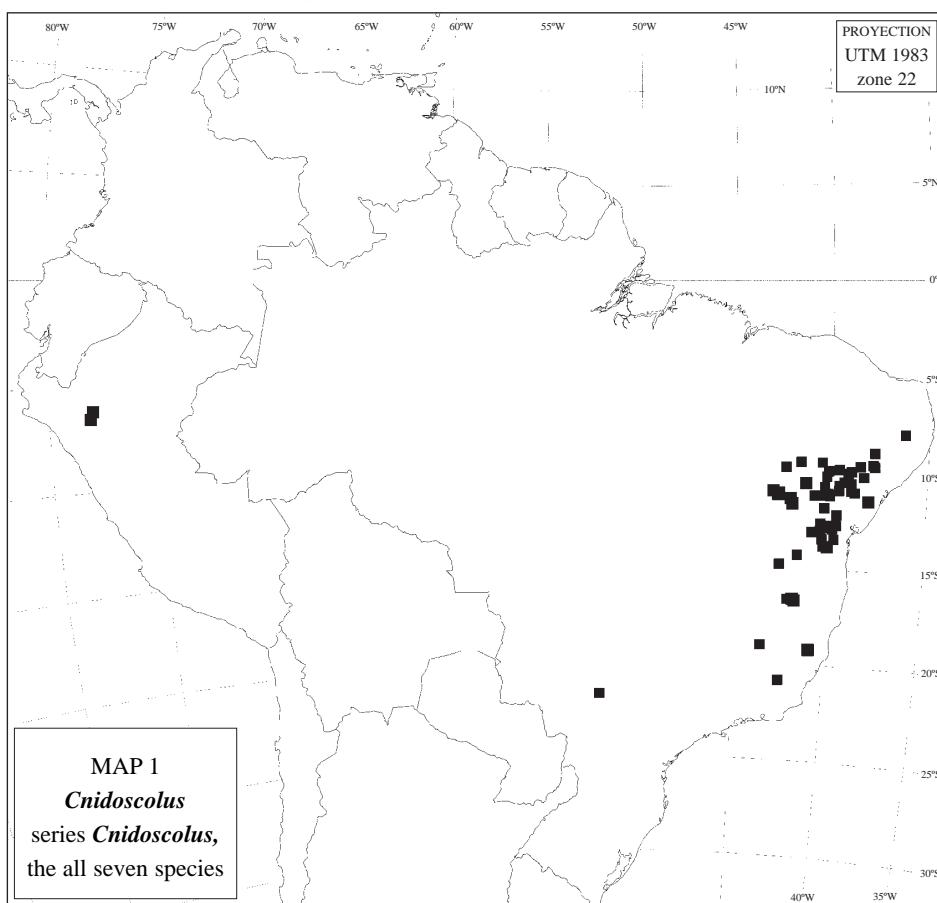

The distribution of the typical section is so far only known in two South American countries: Perú (two species in both departments) and Brasil (five species in eight states). As can be seen on map 1, their distribution is clearly extra-Amazonian.

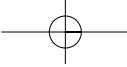

The addition of these two new species described here to the five already known makes a total of seven species, all of them South American, in the configuration of the typical series of the genus *Cnidoscolus*. They can be distinguished with the simple key that continues.

KEY FOR THE SPECIES OF THE SERIES CNIDOSCOLUS POHL, AUTONYMOUS
there are seven species; their distributions are indicated

- 1a Back of leaves white and tomentose or whitish-green 2
- 1b Back of leaves glabrous or pilose, on no account can it be considered white and tomentose or whitish-green 4
- 2a Leaf margins provided with characteristic cylindrical glands; leaf back slightly or very white and tomentose. Brasil (Bahia) 28. *C. rupestris*
- 2b Leaf margins without these cylindrical glands; leaf back fairly white and villose 3
- 3a Leaf lamina 6-10 cm. Fertile stamens ca. 17, 3-verticillate. Perú (Amazonas) *C. hypoleucus*
- 3b Leaf lamina 2-4 cm. Fertile stamens up to 30, up to 6-verticillate. Brasil (Bahia) *C. byssinus*
- 4a Leaf back fairly glabrous; leaves obtuse. Brasil (Bahia) 27. *C. hypokerinus*
- 4b Leaf back slightly or very villous; leaves acute or obtuse 5
- 5a Fertile stamens ca. 26, 6-verticillate. Perú (Cajamarca) *C. Liesneri*
- 5b Fertile stamens <20, 4-verticillate. Brasil 6
- 6a Fertile stamens ca. 15. Leaf margins totally entire. Flowers small, <1,5 cm. Brasil (Espírito Santo, Minas Gerais, Piauí) *C. hamosus*

- 6b Fertile stamens 18-20, 4-verticillate. Leaf margins finely crenated. Large flowers, >2 cm.
Brasil (Alagoas, Bahia, Mato Grosso do Sul, Minas Gerais, Pernambuco, Sergipe)
..... *C. pubescens*

ABBREVIATA DIAGNOSIS vel character essentialis

Ad *Cnidoscolus hamosus* Pohl aliquo modo similis, sed foliis utrinsecus glabris atque obtusis, aculeis rectis nec hamosis, præcipue differt.

MAIN DIAGNOSTIC FEATURES or diagnostic characters

Very similar to *Cnidoscolus hamosus* Pohl but it differs in its obtuse leaves, glabrous on both sides, and in the straight, not hooked, prickles.

LATINA DESCRIPTIO

Sicut collectorum schedula frutex; rami profuse scandentes apicibus ad rupes applicatis; folia discoloria, membranacea; flores masculi albi, antheræ flavæ; flores fœminei stylis lète virentibus.

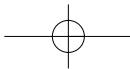

INDUMENTUM. *Setis* urticantibus exceptis planta omnino glaberrima. *Setæ magnæ* 4-5 mm, iuxta basim foliarum in vicem glandularum summipetiolarium dispositæ; rectæ, hyalinæ; basibus striatis, dolioliformis, subpedunculatis. *Setæ mediæ* 1-2 mm, secus margines foliorum antorso dispositæ; rectæ vel levissime sigmoideæ, hyalinæ; basibus asymmetricis oblique insertis.

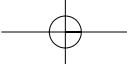

FRUTEX lignosus, ramosus, scandens, prostratus; rami retrosum aculeati. *Aculei* validi, 3-5 × 2 × 3 mm, nitidi, e basi late elliptica acutissimi, apicibus hyalinis. *Cortex* griseo infuscatus, longitudinaliter striatus.

FOLIA setis urticantibus exceptis omnino glaberrima. *Cicatrix* ramo remanente lunulata vel stricte reniformis, quinque cicatricibus vascularibus prædicta. *Stipulae* caducæ, quinque-sex digitatæ, glanduloso capitatae, ca. 1 × 1,5 mm; intus ad basim glandulis ovoideo globulosis pedunculatis præditæ. *Petiolum* brevis, 0,3-0,5(-1) mm, supra canaliculatus. *Glandulae summipetiolares* destitutæ, nisi si setæ urticantes magnæ suum locum occupantes eas fingunt. *Limbus* membranaceus, discolor, obtusus vel emarginatus; *margo* perstrictus albo cartilagineus; *apice* obtuso, cuspidatum; *nervium medium* supra parum impressum vel æquans, subtus prominens, omnino apterum; *nervia lateralia* (4)-5-6(-7) in quoque latere, brochidodroma; *nervia secundaria* reticulo clauso delinquentur.

INFLORESCENTIÆ axillares, breves, laxæ, paucifloræ, omnino glaberrimæ, 3-4 dichasiales. *Pedunculus* primarius 0,5-1,5 cm, validus, trigonus vel tetragonus, florem fœmineum desinens; *secundarius* sursum gradatim infirmior atque brevior. *Bracteæ* triangulares, uninervatae, integerrimæ, 1,5-2 × 1,3-1,5 mm, utrinque eglandulosæ, ad basim glandulis lateralibus globulosis vel subglobulosis præditæ. *Bracteolæ* bracteis similiimæ sed minores, deltoideæ.

FLOS MASCULUS unicus fractus tantum visus. *Corolla* alba, ad 9-10 mm, usque ad medium coalita, glabra, extus albo punctulata, intus parce et tenuissime araneosa; *petala* obtusa, oblongo elliptica. *Discus* sessilis, plus minusve annularis, glaberrimus, glandulosus, ad 0,3 × 0,6 mm. *Columna staminalis* omnino glaberrima. *Stamina* decem

(?, difficilis observartionis), obscure biverticillata. *Antheræ* 0,8-1,0 × 0,5 mm, dosifixæ, submedifixæ, introrsæ, exclusæ. *Staminodia* tres, 6-8 mm, subulato filiformia.

FLORES FÆMINEI ignoti mihi sunt; sed vidi fructum unicum atque centralem in unaquaque inflorescentia. *Calyptra* sub regmate parum evoluta. *Discus* sub regmate remanens subsessilis, glaberrimus, annularis, glandulosus, ad 0,5 × 1,5 mm, integerimus. *Staminodia* quinque, brevia, subulato filiformia, ad 0,3 mm.

REGMA (unum tantum visum) glabrum, apiculatum. *Calyptra* minima, sub regmate inconspicua, obtusissime quinquedentata, margine plano vel modice undulato, strictissimo, coriaceo, glabro. *Epicarpium* herbaceum, rugulosum, ad 0,7-0,8 mm crassum. *Endocarpium* osseum, apicem versus 0,7-0,8 mm crassum. *Sporoecbolus* minimus, aliquo modo figura late reniformis, 1,5 × 1,8 mm, sursum pulvinulis duobus præditus. *Columella* clavæformis, 6 × 1,3 mm, alis tribus percusa.

SEmen (unicum tantum visum) 16-18 × 9-11 × 3-4 mm, ex badio vel læte castanneo albo variegatum; *sedes* minima, ad 1 × 1,5 mm, cordata, ±60° prona, depressionibus duabus prædicta; *dorsum* parum convexum, ecarinatum, basi convexa nec emarginata; *apex* acuto acuminatus; *imaginis linea* (linea perimetralis maxima) fere plano coercita, tantum in apice (dorso propinquæ) atque iuxta sedem (ventri propinquæ) detrusa; *hilum* infra medium carunculam in apiculo ventrali ortum, liberum, carinæ ventralis colligatum; *carina* ventralis omnino picta, læte castanæa, ambabus extremitatibus exceptis fere tota longitudine plana vel levissime convessa; *pleuræ* laterales parum convexæ nec planæ, indistinctæ; *scapulae* læves, læte castanææ; *caruncula* triangularis, 2 × 2,5 mm, albicans, lævis, concolor, dorsaliter ultra apicem extans; carunculæ ventralis figuram aliquo modo late vel transverse trullata exhibet.

REGARDING THE ETYMOLOGY AND ORTHOEPY of the specific name

The specific name comes from a Latinization the Greek name for the barberry –known also in Spanish as arlo, alguese and bérbero–, *hypokerinus*. They recall the leaves of the bush whose scientific name is *Berberis* (*Berberidaceæ*, or *Ranunculaceæ* in a broader sense). This word is stressed on the antepenultimate syllable, *hypokérinus*. *Hypokerinus* is formed by prefixing the Greek genitive preposition ὑπό, meaning below, to the adjective ἐπένειοί ί ί, meaning waxy, with the appearance or consistency of the wax. The name describes the glaucescent and waxy leaf back in the barberry bush. Of course the epithet is not chosen by its literal etymological meaning, but rather for the superficial vegetative resemblance of the barberry with our new species.

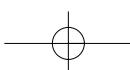

ENGLISH DESCRIPTION

As described in the collectors' label, this bush is very ramified, with branches applied against the rock; discolorous leaves, membranaceous; white male flowers, yellow anthers; female flowers with bright green styles.

INDUMENT. Very glabrous plant, without any trichome formation other than the traditional urticating bristles that characterize the genus. *Large urticating bristles* 4-5 mm, located at the base of leaf lamina, in the place of the summpipetiolar glands; these are straight, hyaline, with lengthwise striated barrel-shaped and subpedunculate base. *Medium-sized urticant bristles* 1-2 mm, born along the leaf margins, antrorse, straight or very slightly sigmoid, hyaline, with their asymmetric bases obliquely inserted.

BUSH woody, ramified, prostrate. *Branches* retrorse prickly. *Prickles* lacerating, 3-5 × 2 × 3 mm, shiny and well defined, very sharp, the base is elliptic and the apex translucent. *Bark* gray bark, with longitudinal grooves.

LEAVES very glabrous, except for the urticant bristles at the base and along the margin; after their fall, the scars remaining on the branch are half moon-shaped or almost reniform, and show the imprint of five vascular bundles. *Stipules* drooping, 5-6-digitata-

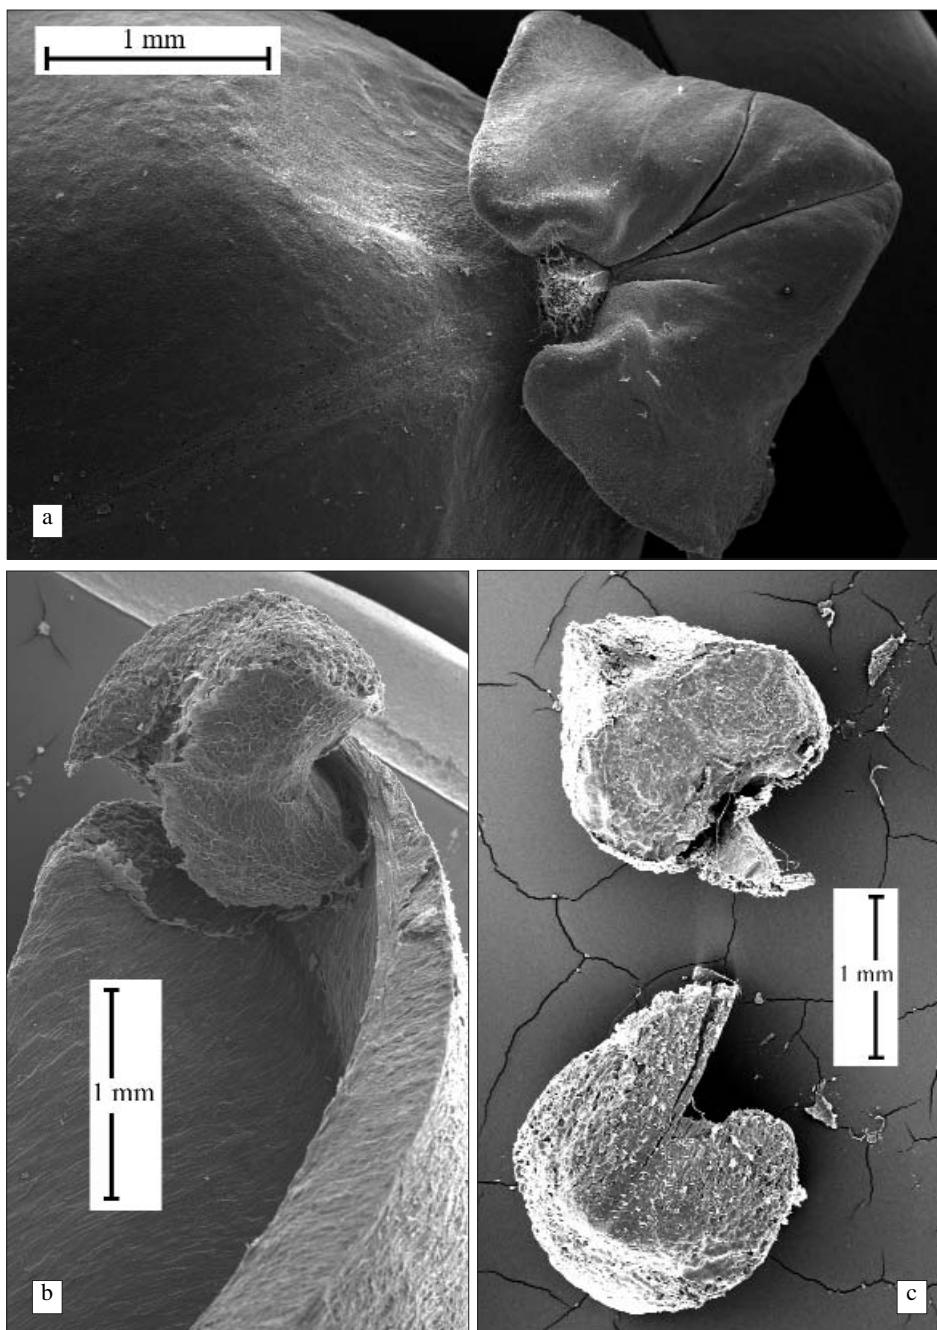

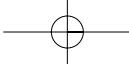

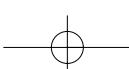

Plate II. *Cnidoscolus hypokerinus* Fernández Casas. a) Seminal caruncle showing the hilum. b) Sporocarole attached to half endocarpic locule. c) Two sporocaroles, upwards (up) and downwards (down).

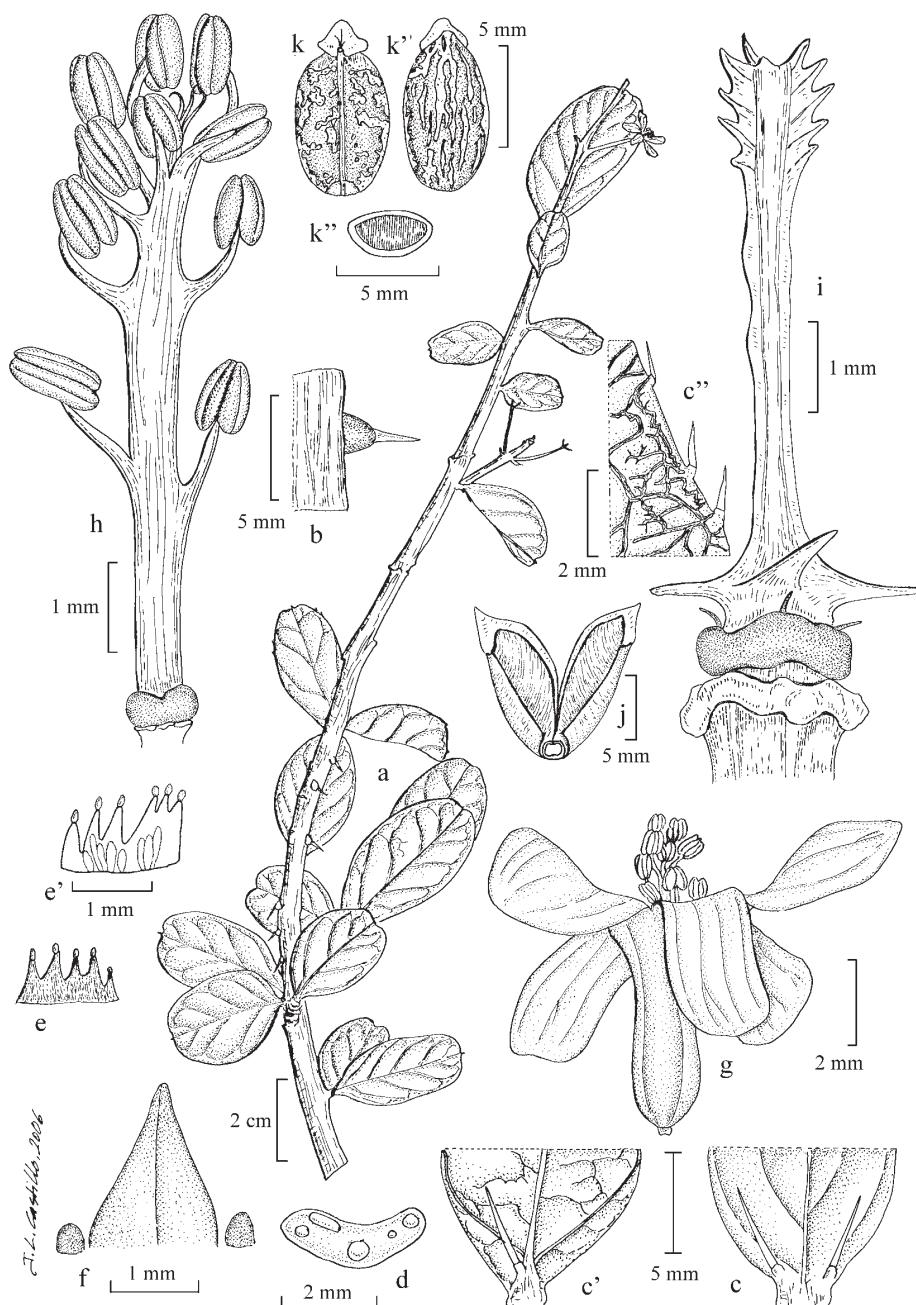

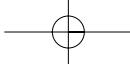

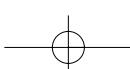

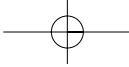

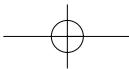

Plate III. *Cnidoscolus hypokerinus* Fernández Casas. E. de Melo 2174 (HUEFS 27686, holotype). a) Fertile branch. b) Prickle. c) Leaf, upper side. c') Leaf back. c'') Margin leaf, with antrorse urticant bristles. d) Leaf scar. e) Stipule, upward. e') Stipule back. f) Hypophyll. g) Male flower. h) Androecium. i) Columella, disc and calyptra. j) Mericarp. k) Seeds.

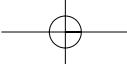

te, glabulose headed, ca. 1×1.5 mm; next to and inside their base they have some ovoid globulose and pedunculate glands. *Petiole* short, 0.3-0.5(-1) mm, grooved on the upper face. *Summipetiolar glands* absent, unless they are represented by some urticant bristles that occupy their exact place. *Leaf lamina* membranous, entire, discolorous, obtuse or emarginate, with a lighter-colored back; *margin* cartilaginous narrow, white; *apex* obtuse, cuspidate; *midrib* slightly imprinted on the face, or even with the lamina, prominent on the back, wingless in all its parts; *secondary nerves* (4-)5-6(-7) to each side, brochidodromous; *tertiary nerves* form a closed tessellated net.

INFLORESCENCES axilar, short, loose, few-flowered, very glabrous everywhere, with 3-4 dichasia. *Primary peduncle* 0.5-1.5 cm, tough, three- or four-angled, ending in a female flower. *Secondary peduncles* gradually smaller and finer. *Bracts* three-angled, one-nerved, entire, $1.5-2 \times 1.3-1.5$ mm, without glands on both pages, with spherical or subglobose glands to the sides, next to the base. *Bracteoles* similar to the bracts but deltoiodes.

MALE FLOWERS. We have only seen one, broken. *Corolla* white, ca. 9-10 mm, connate to half their length, glabrous, with white points on the outside, inside slightly cobwebby. *Petals* elliptic obtuse, oblong. *Disc* sessile, more or less ring-shaped, quite glabrous, glandulose, ca. 0.3×0.6 mm. *Staminal column* glabrous in all its parts. *Stamens* ten (?; difficult to observe), obscurely biverticillate. *Anthers* $0.8-1.0 \times 0.5$ mm, dorsifixed, almost medifixed, introrse and excluded. *Staminodes* three, 6-8 mm, subulate filiform.

FEMALE FLOWERS unknown, but we deduce that there is only one in each inflorescence, as we have been able to observe a single fruit in each one, always in central and basal position. *Calyptra* under the regma poorly developed. The *disc* that can be seen under the regma is sessile, quite glabrous, ring-shaped and glandulose, ca. 0.5×1.5 mm, absolutely entire. *Staminodes* five, short, subulate, thread-like, ca. 0.3 mm.

REGMA (we have only seen one acceptably developed) quite glabrous, apiculate. *Calyptra* almost non-existent, barely visible under the regma, very obtusely 5-dentate, with a flat or slightly wavy, very narrow, coriaceous margin, glabrous. *Epicarp* ca. 0.7-0.8 mm thick, herbaceous, rough. *Endocarp* bony, 0.7-0.8 mm thick towards the apex. *Sporoecbole* tiny, with a somewhat kidney-shaped figure, 1.5×1.8 mm, with two pads in their superior part. *Columella* clavate, 6×1.3 mm, with three percurrent wings.

SEEDS (we have only seen one) $16-18 \times 9-11 \times 3-4$ mm; *testa* variegated on light chestnut background; the seat is very small, ca. 1×1.5 mm, cordate, prone about 60° , with two depressions that fit on the pads of the sporoebole; *back* not very convex, without keel, unnotched base convex; apex acute acuminate; the *maximum perimeter outline* is almost on a single plane, only in the apex it come a little closer to the back, and approaches the ventral part at the base; the *hilum* is born on an apicule, below the caruncle; *ventral keel* totally marked, drawn only, without relief, light brown, flat or slightly convex along their length except for both extremities; *flanks* not very convex and not flat, not very defined; *shoulders* soft, light brown; *caruncule* triangular, 2×2.5 mm, whitish, smooth, concolorous, standing out under the apex when seen from the back; the whole caruncle for the ventral part describes what could be termed a transverse trowel shape.

OBSERVATIONS

Although I have described the ventral keel of the seed like drawn, as marked, that is to say without relief, I see that it is perceived albeit weakly, in the electronic microphotograph in plate iii, fig. a (page 348). This indicates that there is at least a change in texture.

ABBREVIATA DIAGNOSIS vel character essentialis

Ad *Cnidoscolo pubescente* Martius in Pohl aliquo modo similis, habito minore, foliis minoribus, deorsum dense araneoso pubescentibus præcipue discrepat. A *Cnidoscolo byssino* Fenández Casas proximo, foliis maioribus, deorsum minus dense pubescentibus differt. Ab ambabus congeneribus glandulis cylindricis secus margines foliarum atque staminarum numeris intermediis abhorret.

MAIN DIAGNOSTIC FEATURES or diagnostic characters

Very like *Cnidoscolus pubescens* Martius in Pohl but it differs in its smaller size, with smaller leaves having the back densely cobwebby tomentose. Also like *Cnidoscolus byssinus* Fernández Casas, but it differs in being a taller plant, with leaves bigger and less tomentose. From both species it differs in the presence of columnar glands along the leaf margin.

LATINA DESCRIPTIO

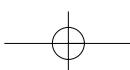

Sicut collectorum schedulæ frutex vel arbuscula usque 3 m × 5 cm ø, aculeatus, urens; folia discoloria, membranacea; alabastra atque bracteæ virentia; petala alba.

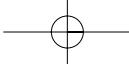

INDUMENTUM. *Setæ* urticantes magnæ atque mediæ foliis, regmatibus atque inflorescentiis frequentes. *Pili* simplices ubique, abaxialiter in foliis copiose dispositi.

FRUTEX 1-3 m, profuse albo lacticiferus. *Rami* vis aculeati; iuvenilis rubro corticatis, veteris griseo corticatis; extremitatis foliatis exceptis pæne aphylli. *Aculei* validi, acutissimi, nitidi, e base elliptica, lateraliter parum compressi; apicibus vulnerantis conicis, hyalinis.

FOLIA magis chartaceis quam herbaceis, in extremitatis ramulorum parum congestis. *Stipulæ* ignotæ, nulla omnino fuit; inter meos studios bahiensis in oblivionem fuit. *Petiolus* brevis, 2-3 mm, modice hirsutus, subcylindricus, iuxta limbum atque adaxialeter vix canaliculatus. *Glandulæ summipetiolares* ut videtur nullæ. *Limbus* oblongus ellipticus vel fere circularis, (2)3-4(5) × (1,5)2-3(4) cm, discolor; supra viridis, glabrus, albo puncticulatus, estimulosus; subtus plus minusve albicantis, araneoso tomentosus, secus nervos præcipue rare stimulus; nullibi neurolomus. *Nervius medius* (longitudinalis) supra parum impressum, subtus valde prominens, modice rubescens. *Nervia lateralia* (secudaria) 6-9 in quoque latere, prona, 45° desinentia, craspedodroma, dentibus glandulosis desinentibus, vel iuxta margines evanida. *Nervia terciaria* reticulum desinentis. *Margo* nec planus, aliquo modo undulatus, grosse dentatus; setis urticantibus magnis inordinatim ciliatus, prorsum pronis; columnis glanduliferis distantibus præditus; columnæ cylindrico pedunculatae, ad 1 × 0,2 mm, præcipue ad basim hirtæ, sursum glabrescens, extremitates glandulosas æquantes, parum dilatatas, iuveniliae cerinæ, digitiformes, vetustæ fuscæ, globosæ vel depresso.

INFLORESCENTIÆ terminales, paucifloræ, 2-3 cm, longitudine foliarum non superantes æquantesve; parum pilosæ; setis rarissimis urticantibus magnis præditæ. *Axes* (vel petioli communis) inferne glabris sursum gradatim minute et rare hirtulis, vix striatis; basalis 7 mm, sursum modice abbreviatis. *Bracteæ* triangulares, glabrae vel pilis rarissimis præditæ; apice interdum glanduloso mucronato; ecarinatae sed ad medianam lineam longitudinalem fusciores; secus margines diminute albociliatae; ad basim in unoquoque latere glandulæ 2-3(-4) ovoideæ, albidæ subalbidæve præditæ; geminatae ad nodos amplectentes; inferne plane sejunctæ, superne plus minusve coalitæ. *Bracteolæ* bracteæ simillimæ sed

minores.

FLORES MASCULI. *Pedunculus* nullus vel subnullus, id est flos sessilis. *Alabastra* claviformia, dense et minute albo pubescentes, præcipue sursum stimulosa, æstivatione quinquinali; ad 3/7 in tubum stricte turbinatum connata. *Corola* alba, parum supra media longitudine in tubum cylindricum connata, hypocraterimorpha; pertalorum pars libera patens, ad basim se invicem parum tegentes, modice cochleariformis. *Discus* annularis, cerinus, glaberrimus, glandulæ quinque coalitæ instructus. *Columna* staminalis omnino glabra, longitudinaliter striata. *Stamina* 20, quattuor verticillata. *Antheræ* inferiores ad 1,5 × 0,7-0,9 mm, superiores gradatim minores; supremæ exclusæ, reliqua inclusa, omnia introrsæ, subbaifixæ; connectivum strictum. *Staminodia* quinque, apicalia, filiforme subulata, inter antheras supremas exstantia.

FLORES FEMINEI difficile observandas, harum fragmenta tantum observata fuerunt. *Pedunculus* nullus vel subnullus. *Caliptra* minima, parum conspicua, margine glabro, undulato. *Corola* ad basim 2-3 mm connata; petalorum pars libera 10-12 × 2-3 mm, linear spathulata, extus albovillosa, intus margine lato piloso excepto glabra. *Discus* minimus, glabrus, annular cylindricus, longitudinaliter striatus, sessilis id est discopodio destituti. *Staminodia* 6-8? minutissima, <0,5 mm, subulata, quam discus lævivora. *Ovarium* iuvenile non vidimus, vide regmata. *Styli* tres, perbrevi, tota longitudine liberi, interdum furcati, extus arcuati. *Stigmata* non observata.

REGMA ovoideum, apice excepto setis urticantibus vestitum, horridum, minutissime hirtum (sub lente); styli remanentes coronatum; sub maturitate læte viride, in tertio distale viride fuscior, lineas sex longitudinales, exalbidas, percufo.

REGARDING THE ETYMOLOGY AND ORTHOEPY of the specific name

The specific name is formed from the Latin adjective *rupestrīs*, -e, meaning rock-dwelling, characteristic of rocks and cliffs. It is stressed on the penultimate syllable (paroxytone): *rūpēstrīs*. According to the label of the type, the plant lives in stony grounds and steep crags. Our own field observations (Santo Inácio, 2006) corroborate this preference for rocky conditions.

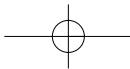

ENGLISH DESCRIPTION

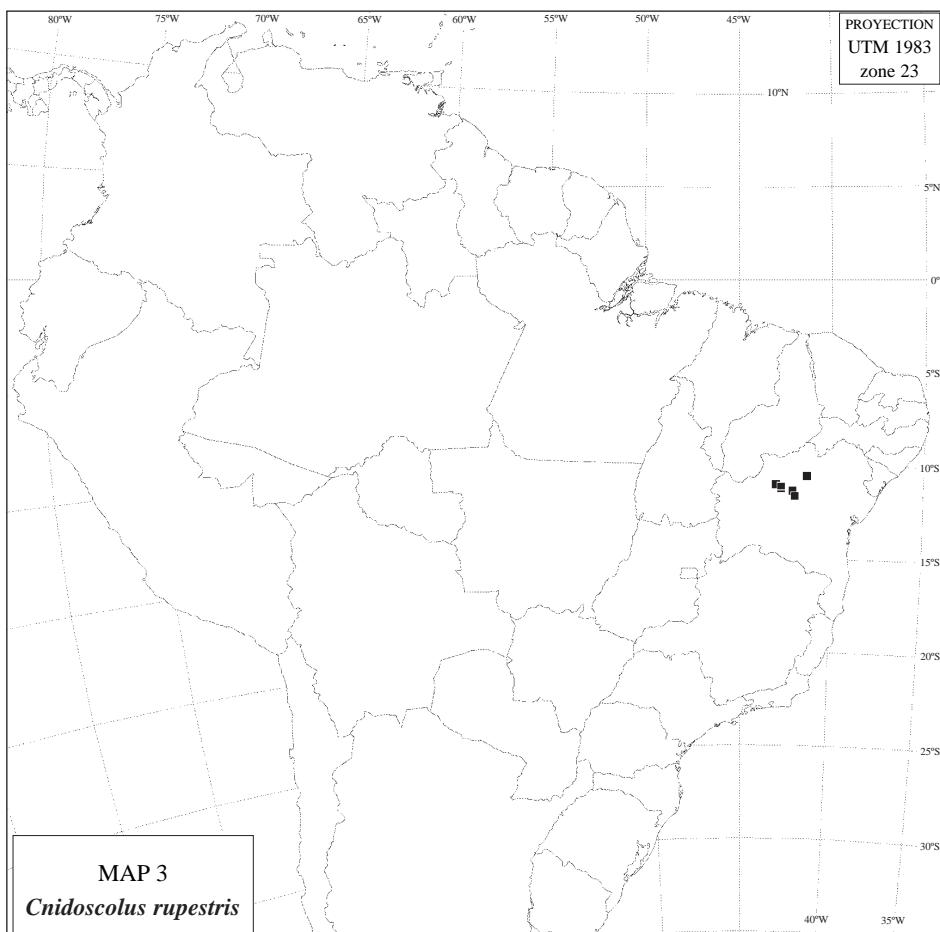

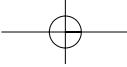

According to the collectors' labels, it is a bush up to 3 m × 5 cm Ø, with prickles, urticant; discolorous and membranaceous leaves; greenish flower buds and bracts, white petals.

INDUMENT. *Urticant bristles* big and medium sized frequent in the leaves, fruits and inflorescences. *Simple hairs* everywhere, very abundant on the back of the leaves.

BUSH 1-3 m, abundant white latex. *Branches* strongly aculeate, from can be seen in the pictures (plate vi and vii, pages 355 and 356 respectively), the *bark* in the juvenile plants is red, and gray in the older ones; regularly without leaves, except at their extremities. *Prickles* with elliptic, slightly compressed laterally, conical point, translucent and lacerating.

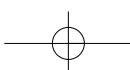

LEAVES more chartaceous than herbaceous, regularly grouped at the end of the branches. *Stipules* unknown, I saw none; I forgot them when studying the Bahian herbarium vouchers. *Petiole* short, 2-3 mm, moderately hirsute, almost cylindrical and lightly grooved on the face next to the lamina. *Summitpetiolar glands* absent, there is not trace of them. *Lamina* oblong or elliptic, (2)3-4(5) × (1,5)2-3(4) cm, discolour (the two faces are unlike in colour), upper face green and with tiny white spots, without urticant bristles; the back has some urticating bristles along the main nerves, more or less whitish, slightly or very cobwebby pubescent; no part is pedate. *Middle radial veins* slightly raised or level with the face, prominent on the back, it is somewhat reddish and extends along the whole length of the lamina, ending in an apical tooth. 6-9 lateral nerves each side, more or less straight, forming an angle of 45° with the radial nerve, scarcely rami-

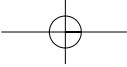

fied except at the ends, where they disappear; cheilodrome reaching the margin where they finally penetrate a glandular tooth, or almost disappear in the margin. *Tertiary nerves* netted, not at all flat, somewhat undulating, coarsely dentate; uneven ciliate, with large urticating bristles, slightly forward-leaning, with scattered glandular columns, cylindrical, long, ca. 1 × 0,2 mm, consisting of a hirsute hairy column, or unequally glabrescent in the distal part; the small gradually differentiated glandular head has a waxy shine, or dark and dull when it is more developed, spherical or depressed, with a diameter which slightly exceeds that of the column that supports it.

INFLORESCENCES terminal, few-flowered, 2-3 cm, shorter or almost equaling the length of the leaves; slightly hairy; with scarce large urticant bristles. Axes inferiorly glabrous, upward progressively and sparsely hirsute. *Bracts* triangular, glabrous or with one or two little hairs; the apex in occasions mucronate and glandular; margins with tiny white cilia, without keel, but with a darker area towards the longitudinal midway line; they embrace the facing axes at the nodes; the lower ones remain distinct, while the upper ones are welded by their ends. *Bracteoles* similar to the bracts but smaller,

frequently welding the facing pairs by their bases.

MALE FLOWERS. *Peduncle* non-existent or almost non-existent, the flower is set in. *Floral buds* club-shaped, with short, white dense hairiness, with scarce urticant bristles on the upper part, with quincuncial aestivation; connate 3/7 of their length in turbinete tube. *Corolla* immaculate white, salver-shaped, welded into a cylindrical tube up to slightly over half its length. *Petals* with their free part patent, slightly imbricate at the base, something spoon-shaped. *Disc* ring-shaped, glabrous, waxy, made up of five connate glands, not very differentiated. *Staminal column* glabrous all over, grooved lengthwise. *Stamens* 20, 4-verticillate. Lower *anthers* ca. $1.5 \times 0.7\text{-}0.9$ mm, the upper ones gressively smaller; the highest excluded, others included, all introrse, almost basifixed; relatively narrow connective. *Staminodes* five, apical, filiform subulate, they protrude from the anthers of the highest verticille.

FEMALE FLOWERS observed with difficulty, incomplete. *Peduncle* absent or almost absent; flowers set in. *Calyptora* barely distinguished, very little developed, with glabrous undulated margin. *Corolla* 2-3 mm connate at the base, forming a short wide tube; free part of the five petals $10\text{-}12 \times 2\text{-}3$ mm, hairy, spatulate or strap-shaped, villous on the outside and glabrous inside, except near their outer border, where they are also pubescent. *Disc* (observed under the regma) little developed, glabrous, ring-shaped cylindrical, grooved lengthwise, lacking discopode, that is to say, set in. *Staminodes* 6-8?, small, subulate, more brightly colored than the disc. *Ovary* not seen; see the morphology of the regma. *Staminodes* very small, of less than 0,5 mm, of a lighter color than the disc. *Styles* very brief, free their whole length, on occasion forked, outward-arching. Stigmas unknown.

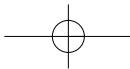

REGMA ovoid, except the apex, completely clothed in urticant bristles, horrid minutely hirsute (under magnifying glass); ending with the three persistent styles; light green but darker in the upper third, with six delicate, longitudinal, whitish lines with a kind of spherical 30° spindles defined on their surface.

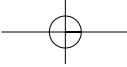

OBSERVATIONS

Very similar to *Cnidoscolus pubescens* Martius in Pohl and to *C. byssinus* Fernández Casas, cf. F. J. FERNÁNDEZ CASAS (2003), F. J. FERNÁNDEZ CASAS & J. M. PIZARRO DOMÍNGUEZ (2005). Observed in the field (visit to Santo Inácio, 25-II-2006) it appears to be exactly intermediate; its external morphology suggests that it is a hybrid of both species, which are indeed sympatric. In addition to its habit, it has an intermediate number of stamens, the leaf size and the pubescence on the back; the indument varies considerably; there are leaves –generally large–with slight cobwebby pubescence, whitish or yellowish, revealing the abaxial epidermis; others on the other hand –generally small– have on the back a layer of dense white tomentose that doesn't allow to see the abaxial epidermis, other on the other hand –regularly of small size– have on the back a layer of dense white tomentose that does not permit the abaxial epidermis to be seen.

It also appears to have its own characters, such as the glands of the leaves margin, the columnar glands described as having a half-cigarette shape. Many other characters of the reproductive system also appear to be different, but the observations have not been very extensive and it would therefore be advisable to wait until more and better materials are available.

We made no studies of floral biology, nor did we analyze the pollen fertility, as we were unable to collect any material without the relevant permission from the local authorities when we visited the area this year. However the populations thriving on the rocks near Santo Inácio seemed to be very healthy; the plant grew in abundance there and was blooming profusely, also for-

ming fruits which were juvenile at the time but appeared healthy (see our figures, a and b on plate vii, on page 355).

All the shrubs were bushes which were very ramified at the base and slightly ramified elsewhere; we saw no monopotic specimens nor any with a treelike appearance, as can frequently be seen in Martius' species, *Cnidoscolus pubescens*.

Árvore ca. 3 m, ramos 5 cm Ø; flôres com botões e sépalas verdes, corola alva», P. Gasson, A. M. Giulietti, R. H. Harley & E. N. Lughadha, PCD 6131, 08-III-1997 (ALCB 37469; CEPEC 74516; HUEFS 28554; SP 359783; SPF 127063). Folia magna.

ACKNOWLEDGEMENTS

Miguel Jerez Luna took the electronic microphotographs for plates ii (page 348) and v (page 354). Ulpiano Emilio Souto Mandelos processed the digital photographs for plates i (page 347), iv (page 353), vi (page 355) and vii (page 356); he also made the three distributional maps (pages 344, 350, 358). Juan Castillo Gorroño drew plate iii (page 349).
